

Feedback on App

1) Can the App create an experience where users ~~feel~~ feel connected to an actual persona feel they are ~~connecti~~ interacting with a person/persona on the other end & on every step of in the workflow?

Establishing that connection upfront might improve chances of users ~~completing the going th~~

Sustaining through the entire program: Perhaps - setup one of several personas acting as a companion

2) Onboarding Questionnaire in all apps are generally longer than what users want to fill out.

~~Can we make it simpler~~

Can we replace the entire questionnaire with perhaps requests for 3-4 ~~image~~ photos, e.g.

a) Full-length photograph of user

b) photograph of ~~their~~ the contents of their fridge

c) photograph of their meal plates

d) the room/space where they spend most of

e) ~~their time~~ family photo

With the above, can we estimate

→ Age

→ Height / weight / BMI

→ Visceral fat

→ Dietary Preferences

→ Exercise Patterns

22) I don't have a sense of how the app works, once after enrollment.

- 3) Estimates may give us ranges (e.g. Age, BMI ^{range}) instead of precise numbers...
My guess is that ~~the~~ the app doesn't require precise information to chalk out a program. ~~Isn't~~ Isn't that true?
- 4) ~~The AI may realize that it doesn't~~
4) When the AI realizes it needs more information / confirm its understanding - ~~It~~ It should have a way to initiate a conversation with the user.
I get the feeling that a voice agent mirroring the companion persona established upfront might be more effective than an HTML form.
Alternatively, the HTML form should be replaced with a more chat/text conversation style interface.
- 5) Are the questions posed during ~~the~~ onboarding (to a program) fixed? or do they adapt based on previous responses.
I am thinking it is the latter since the deployed app says "thinking" between screen transitions.
However, the prototype says (step) 1 of 8 - which feels ~~more~~ more like a fixed length questionnaire.
- 6) I notice that questions are chunked in counts of ~~2/3~~ 2 or 3. While this is much better than presenting the entire questionnaire, it still leads to situations where the subsequent question stands irrelevant after answering the prior.

For each program How much autonomy does the AI have in selecting / posing / sequencing questions during onboarding?

Is there a question bank?

How easily can new questions be introduced?

For e.g. I was expecting questions related to:

a) my work patterns (Desk job / out in the field)

b) Family history (of disease)

c) How much water I drink! (Hydration)

d) Smoking / Drinking habits

e) who is at home.

f) Which part of the country I am from?

g) Bowel movements

h) Sense of Hunger (Appetite)

These are ~~standard~~ questions which ~~any~~ doctors ~~ask~~ ^{usually} ask us while trying to understand us.

There will always be an infinite number of questions to pose - and we'll always leave something out.

So, maybe the way out is to give AI more autonomy, with the hope that it poses ~~the~~ the right questions based on information it knows / does not know.

8) I did feel that the same question needs to be posed in a different way ^(language) depending on the age of the user - 68 F versus 25 M.

The current state of the questions ~~seems to work~~ works well for tech savvy individuals.

For e.g. ~~my~~ ^{A 68F} mother wouldn't be able to figure out the ~~conf~~ - "what's in your mind today?" question where the answer is solicited in the form of a Confusion Matrix.

I myself found the options a bit ~~hard~~ ^{hard} to interpret.
: Wired and for

9) If I ~~to~~ enroll into such a program, I'd always like to know:

- Who are my peers?
- What is their experience?
- ~~How are they~~ Has anyone tasted success?
we should see, ~~how we could prove~~ what type of information (at an aggregate level) can be presented back for consumption?

10) Does the app assume that the user is very clear about the path they want to take - e.g. exercise vs diet vs medication?
For someone who doesn't think in terms of these various paths / subconsciously open to any path / wants to be given a recommendation that make a choice - this step might be confusing / counterproductive / unintuitive.

11) If a doctor is recommending a program, we should see how information about the patient can be seeded from the doctor instead of ~~us~~ starting from scratch. This could be in the form of

- Prescription
- some information on practice

12) A year back, I signed up for a "Gut Wellness Club" program.

- Onboarding questions - mostly image based
- WhatsApp group dedicated - quickly answer questions / doubts
- Every 4 days ~~dedicated~~ 1-1 doctor call (junior)
- Food/Diet shipped along with the program
- Daily checkout - mostly photographs - Tongue, weight etc
- Final Review with senior doctor yoga/meditation

The periodic human connect ^{is what I felt was the most important - specific control over your diet.}

9) Shorter program by design - 15 days

- 13) It felt they ^{already} had a well defined / ^{proven} solution, and then they took it online with an app to scale better.
- 14) In this case - are we doing it the other way around - where we build the app ~~with~~ first, and ~~have the solution~~ and hope the solution works out well for participants?
- a) we still have no way to control their diet
 - b) Dependency on content/video for yoga/exercise, meditation.

- 14) Do you expect to hire operations staff to monitor/guide the participants. I think we would need to - for a better chance at success. All the more important, considering the program is lengthier - at least 3 months? I would think - even for the Private Alpha, there would be quite a bit of operational staffing requirements.

- 15) we would eventually need: ^{Curated} Educational
- a) ~~Content~~ Quality Content + Articles, Videos, ~~Exercise~~ Guided/Recorded Exercises
 - b) Partnerships with food providers
 - c) Partnerships with ~~Doctors~~
 - d) Tele calls.

~~16) When I look at a program, I usually~~

- 16) Before enrolling for such programs, I usually ~~can't~~ visit their website, find out who the promoters are - and how experienced they are in their field of operations.

For the Gut Wellness - ~~the story~~ was about an Ayurvedic Doctor experienced in the field and having figured out how to use natural Ingredients to resolve gut issues.

17) On boarding had a screening process. If they determine they can't help you / you may not benefit from their program, they let you know upfront and return your money. They specifically told us: Make sure - the next 15 days you can work from home.

~~18) Share some~~

18) Sharing some screenshots and manuals from the Gut Wellness program.

19) When I signed up for Gut Wellness Club, ~~they gave me~~ they shipped the food ingredients along with a nice carrybag. It felt nice to have received something useful. ~~Psychologically, these small things~~ We should think about something similar. These small gifts ~~can~~ help improve engagement levels.

20) Challenges we face:

- a) Sustaining engagement across ~~3 month~~ ~~periods~~ extended time periods (3 months)
- b) Reliance on individual to ~~self~~ monitor self-monitor and report progress
- c) Managing breaks ~~for e.g.~~ (e.g. 1 week vacation), Restart after break.
- d) Convincing doctors about the benefits.

21) Would the App add more work ~~to~~ for the Doctor?
eg- Previously I would monitor once in 2 weeks, now I monitor daily.
Would the App get into the doctor's own Business? My ~~one~~ patient visits me less often because the app connected him to a Nutritionist.
